We provide the following definitions for terms you may be unfamiliar with:

**AL** = Action Level or the concentration of a contaminant that, if exceeded, triggers treatment or other requirements which system must follow.

**MCL** = Maximum Contaminant Level, or the maximum permissible level of a contaminant in water which is delivered to any user of a public water system.

**MCLG** = Maximum contaminant level goal. The maximum level of a contaminant at which no known or anticipated adverse effect on health of persons would occur, and which allows for an adequate margin of safety. MCLG s are non-enforceable public health goals.

**MRDL** = The highest level of disinfectant (chlorine, chloramines, chloramine dioxide) allowed in drinking water. There is sufficient evidence that addition of a disinfectant is necessary to control microbial contaminates.

**MRDLG** = The level of drinking water disinfectant (chlorine, chloramines, chlorine dioxide) below which there is no known or anticipated adverse effect on health of persons.

**ppb** = One part per million (one penny in ten thousand dollars).

**ppm** = One part per million.

**ug/l** = Micrograms per liter.

**Action Level or the concentration of a contaminant that, if exceeded, triggers treatment or other requirements which system must follow.**

**Maximum Contaminant Level, or the maximum permissible level of a contaminant in water which is delivered to any user of a public water system.**

**Maximum contaminant level goal. The maximum level of a contaminant at which no known or anticipated adverse effect on health of persons would occur, and which allows for an adequate margin of safety. MCLG s are non-enforceable public health goals.**

**The highest level of disinfectant (chlorine, chloramines, chloramine dioxide) allowed in drinking water. There is sufficient evidence that addition of a disinfectant is necessary to control microbial contaminates.**

**The level of drinking water disinfectant (chlorine, chloramines, chlorine dioxide) below which there is no known or anticipated adverse effect on health of persons.**

**One part per million (one penny in ten thousand dollars).**

**One part per million.**

**Micrograms per liter.**

**What are possible contaminates?**

Microbial contaminates, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, livestock operations or wildlife. Pesticides and Herbicides from agriculture, storm water runoff or residential runoff.

Inorganic contaminates such as salts and metals which can be naturally occurring or result from runoff, industrial or domestic wastewater, oil and gas production, mining or farming.

Organic chemical contaminates including synthetic and volatile organic compounds which are by-products of industrial processes and petroleum production, and can come from gas stations, runoff or septic systems.

Radioactive contaminates, which can occur naturally or result from oil and gas production or mining.

**What about Cross connections?**

A cross connection is a connection between a drinking water pipe and a polluted source. The pollution can come from your home. For instance, you are going to spray fertilizer in your lawn. You hook up your hose to the fertilizer sprayer. If the water pressure drops (say because of a fire hydrant use in town) the fertilizer may be sucked back into the water pipes through the hose. Using a backflow device on the hose can prevent this. The department recommends using a device such as a vacuum breaker for all inside and outside hose connections. This low-cost device is available at hardware or plumbing stores. This will help protect your water system. Contact your water department for information.

**You can reach the Water Department at any time by calling (413) 665-3080 Or email Water@whately.org**

**Important information about your drinking water.**

Our water system violated drinking water standards over the past year. Even though these were not emergencies, as our customers, you have the right to know what happened and what we did to correct the situation.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During the third quarter of 2019 we did not complete all monitoring or testing for arsenic due to a laboratory error and therefore cannot be sure of the quality of our drinking water during that time.

**What should I do? There is nothing you need to do at this time.**

We are required to sample for arsenic quarterly. In 2019 we sampled the first, second and fourth quarters, but missed the third quarter due to a lab error. We are monitoring more closely the sample schedule to make sure this does not happen again.

For more information, or if you have any questions please contact Superintendent Wayne Hufkosi at 665-3080 or email at water@whately.org.

Please share this information with all the other people who drink this water, especially those who might not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.
Fact #1
Your public water supply is safe and clean. Our department consistently meets or exceeds all water quality standards set forth by the U.S. Environmental Protection Agency and the MA. Department of Environmental Protection

Fact #2
Drinking water may reasonably be expected to contain some small amounts of contamination. The presence of contaminants does not necessarily indicate that the water poses a health risk. Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised persons such as persons with cancer undergoing chemotherapy, those who have undergone transplants, those with HIV/AIDS or other immune system disorders. Some elderly and infants can be at risk for infection. These persons should seek advice from their medical provider.

Fact #3
You can contact the EPA at 800-426-4791 for more information on contaminants and their health effects. EPA/Centers for disease Control and prevention guidelines an appropriate means to lesson the risk of infection from Cryptosporidium and other Microbial contaminants are available at this number.

Fact #4
YOU CAN REACH THE WATER DEPT. AT ANY TIME BY CALLING 665-3080
Wayne Hurtoski  Superintendent
Georgianne Duftall  Chair water commission
George Buccala  Water Commissioner
Paul Fleuriel  Water Commissioner
The Commissioners meet on the first Tuesday of the month in the Town Offices at 4 Sandy Lane.

Fact #5
Iron and Manganese are naturally present in our water supply. Water is often discolored during peak demand and flow. Although discolored and unattractive, the water is still safe to drink.

Fact #6
Sources of drinking water include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of land or through the ground it dissolves naturally occurring minerals. In some cases, radioactive materials and substances resulting from the presence of human and animal activity can be picked up.

WATER ANALYSIS REPORT
PUBLIC WATER SUPPLY # 1337010

Below you will find a table showing the results of any tests which we performed, which detected a contaminate. There were no violations of standards. Any detected contaminate are reported

Manganese is a naturally occurring mineral found in rock, soil, groundwater and surface water. Manganese is necessary for proper nutrition and is part of a healthy diet, but can have undesirable effects on certain sensitive populations at elevated concentrations. The EPA and Mass DEP have set an esthetics based Secondary Maximum Contaminant level (SCML) of 50ug/l 50 parts per billion. In addition, MassDEP’s Office of Research and Standards (ORSG) has set a drinking water guideline for manganese which closely follows the EPA public health advisory for manganese.

Drinking Water may naturally have manganese and when in concentration greater than 50 ug/l the water may be discolored and have a bad taste. Over a lifetime, the EPA recommends that people drink water with levels 300 ug/l and over the short-term EPA recommends people limit their consumption of water with levels over 1000 ug/l, primarily due to concerns about possible neurological effects. Children up to 1 year of age should not be given water with a concentration over 300 ug/l, nor should formulas for infants be made with that water for more than ten days.

The ORSG differs from the EPA’s health advisory because it expands the age group to which a lower manganese concentration applies from children less than 6 months to children up to 1 year to address concerns about children’s susceptibility to manganese toxicity. See EPA Drinking Water Health Advisory for Manganese
http://www.epa.gov/safewater/ccl/pdfs/reg determine1/support cc1 manganese dwreport.pdf
And Mass DEP ORSG for Manganese

Construction of a filtration system to remove manganese from the water was finished and put online in October of 2019

While your drinking water meets the EPA standards for arsenic, it does contain low levels of arsenic. EPA’s standard balances the current understanding of arsenic’s possible health effects against the task of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans in high concentrations and is linked to other health effects such as skin damage and circulatory problems.

If present elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Whately Water Department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

The Department Has a waiver for testing of Synthetic organic compounds.
